AXP717 Single Cell NVDC PMU with E-gauge

1 Features

- 3.9V–5.5V Input Operating Range and Support single Cell Battery
- Battery fuel gauge: E-gauge 3.0
- Support TWSI(Two Wire Serial Interface) and RSB(Reduced Serial Bus)
- 3A switch charger, CV accuracy +/-0.5%
- Support USB BC1.2& type C CC input
- High battery discharge efficiency with 30 mΩ
- High integration includes all MOSFETS, current sensing and loop compensation
- Power off current <35uA (BATFET off, RTCLDO output on)
- Ultra low power mode(Green mode)support
- 4 DCDC(DCDC4 is not available in charger mode)
  DCDC1:0.5~1.54V, IMAX=4A
  DCDC2: 0.5~3.4V, IMAX=3A
  DCDC3: 0.5~1.84V, IMAX=1.5A
  DCDC4: 1.0~3.7V, IMAX=3A
- 14 LDOS
  RTCLDO: 1.8V/2.5V/3V/3.3V, 30mA; Support supplied by backup battery (button battery)
  ALDO1/4, BLDO1/4, CLDO1~4:
  0.5~3.5V, 0.1V/step, IMAX=400mA
  ALDO2/3, BLDO2/3:
  0.5~3.5V, 0.1V/step, IMAX=200mA
  CPUSLDO: for CPUs, 0.5~1.4V, IMAX=30mA, Supplied by DCDC3
- Startup sequence and default voltage of DCDC/LDO setting
- Sleep/Wake up/Fast Wake up support
- Charging LED with breathing function
- Protection
  Input Over-Voltage Protection
  Battery Thermal Sense Hot/Cold Charge Suspend
  Programmable Safety Timer for Charger
  Die Thermal regulation for Charger
  Thermal Shutdown
  DCDC Over-Voltage/Under-Voltage Protection
  LDO Current Limit Protection

2 Applications

- Tablets, E-ink , Smart speaker, Vacuum

3 Description

AXP717 is a highly integrated power management IC (PMIC) targeting at single cell Li-battery(Li-ion or Li-polymer) applications that require multi-channel power conversion outputs. It provides an easy and flexible power management solution for multi-core processors to meet the complex and accurate requirements of power control.

AXP717 supports NVDC switch charge. Besides, it supports 17 channel power outputs which include 3 channels DC-DC and 14 channels LDO. To ensure the security and stability of the system, AXP717 provides multiple channels 14-bit ADC for voltage/temperature monitor and integrates protection circuits such as over-voltage protection (OVP), over-current protection (OCP) and over-temperature protection (OTP). Moreover, AXP717 features a unique E-Gauge™ (Fuel Gauge) system, making power gauge easy and exact.

AXP717 supports TWSI and RSB for system to dynamically adjust output voltages, charge current and configure interrupt condition

4 Pin Configuration and Functions

Figure 4-1 Pin Map

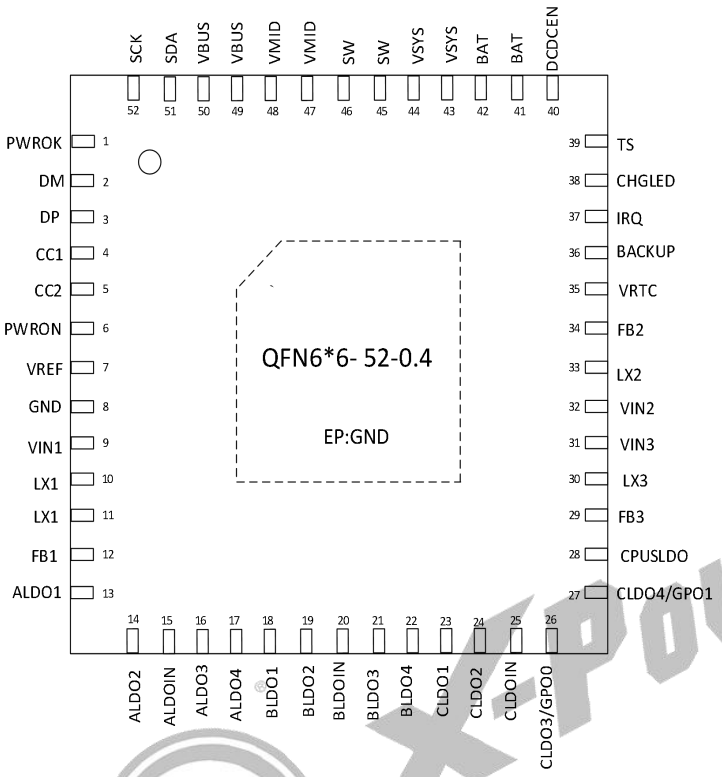

Table 4-1 Pin Description

NO.	Pin Name	I/O(1)	Description
1	PWROK	DIO	Power good indication output
2	DM	DIO	BC1.2 detection, connect to DM of USB connector
3	DP	DIO	BC1.2 detection, connect to DP of USB connector
4	CC1	DIO	Type-C cc logic, connect to CC1 of USB connector
5	CC2	DIO	Type-C cc logic, connect to CC2 of USB connector
6	PWRON	DIO	Power On-Off key input, Internal pulled up.
7	VREF	P	Internal reference voltage
8	GND	G	GND for internal analog circuit
9	VIN1	PI	DCDC1 input source
10/11	LX1	PIO	Inductor pin for DCDC1
12	FB1	AI	DCDC1 feedback pin

CopyrightShenzhen X-Powers Technology Co., Ltd. All Rights Reserved.

13	ALDO1	PO	Output pin of ALDO1
14	ALDO2	PO	Output pin of ALDO2
15	ALDOIN	PI	ALDO input source, connected to VSYS
16	ALDO3	PO	Output pin of ALDO3
17	ALDO4	PO	Output pin of ALDO4
18	BLDO1	PO	Output pin of BLDO1
19	BLDO2	PO	Output pin of BLDO2
20	BLDOIN	PI	BLDO input source, connected to VSYS or DCDC output
21	BLDO3	PO	Output pin of BLDO3
22	BLDO4	PO	Output pin of BLDO4
23	CLDO1	PO	Output pin of CLDO1
24	CLDO2	PO	Output pin of CLDO2
25	CLDOIN	PI	CLDO input source, connected to VSYS or DCDC output
26	CLDO3/GPO0	PO	Output pin of CLDO3 or GPO0(open drain)
27	CLDO4/GPO1	PO	Output pin of CLDO4 or GPO1(push pull)
28	CPUSLDO	PO	Output pin of CPUSLDO
29	FB3	AI	DCDC3 feedback pin
30	LX3	PIO	Inductor pin for DCDC3
31	VIN3	PI	DCDC3 input source
32	VIN2	PI	DCDC2 input source
33	LX2	PIO	Inductor pin for DCDC2
34	FB2	AI	DCDC2 feedback pin
35	VRTC	PO	RTC power output
36	BACKUP	P	Input pin of backup battery.
37	IRQ	DIO	IRQ output. Connect the IRQ to a logic rail via a resistor. The IRQ pin sends a low level signal to host to report device status and fault.
38	CHGLED	DO	Charge status output to indicate various charger operation. In no battery mode, CHGLED pin can be the feedback pin of DCDC4
39	TS	AI	Battery Temperature Sensor Input
40	DCDCEN	DO	Be connected to external DCDC enable pin. The start-up sequence of DCDCEN is the same as that of CLDO2. High level available, internal pulled up to RTCLDO.

6 Detail Description

6.1 Overview

AXP717 is a highly integrated power management IC(PMIC) targeting at single cell Li-battery (Li-ion or Li-polymer) applications that require multi-channel power conversion outputs. It provides an easy and flexible power management solution for multi-core processors to meet the complex and accurate requirements of power control.

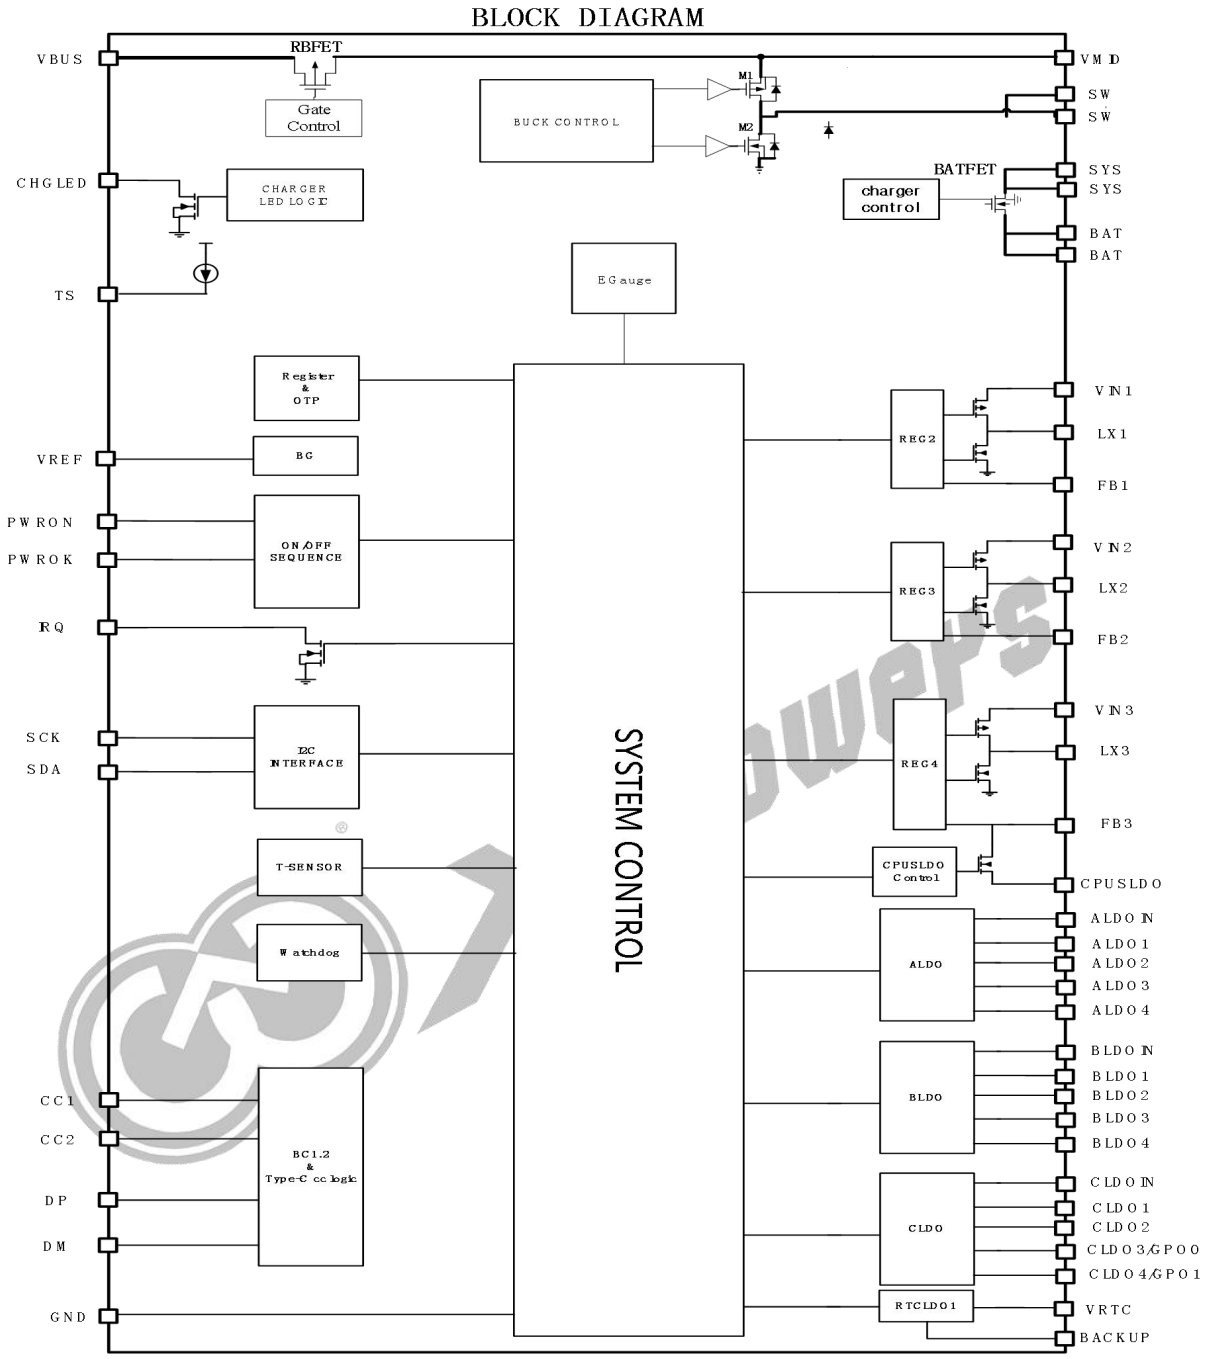
AXP717 supports 3A switch charger. Besides, it supports 17 channel power outputs which include 3 channel DCDCs and 14 channel LDOs. To ensure the security and stability of the system, AXP717 provides multiple channels 14-bit ADC for voltage/temperature monitor and integrates protection circuits such as over-voltage protection(OVP), over-current protection(OCP) and over-temperature protection(OTP). Moreover, AXP717 features a unique E-Gauge™ (Fuel Gauge) system, making power gauge easy and exact.

AXP717 supports TWSI and RSB for system to dynamically adjust output voltages, charge current and configure interrupt condition.

AXP717 is available in 6mm x 6mm 52-pin QFN package.

Copyright Shenzhen X-Powers Technology Co., Ltd. All Rights Reserved.

6.2 Function Block Diagram



CopyrightShenzhen X-Powers Technology Co., Ltd. All Rights Reserved.

6.3 Serial Interface Communication

AXP717 supports TWSI protocol and performs as a TWSI slave device with default address 0x68/0x69(8 bits). When AXP717 powers on, SCK/SDA pin of TWSI will be pulled up to IO Power and then Host can adjust and monitor AXP717 with rich feedback information.

Besides, AXP717 supports RSB for Allwinner platform with address 0x01D1 or 0x0273 by customer.

Note: “Host” here refers to processor.

6.4 Power Path

VBUS as the charger input, connecting to VSYS pin through a switch charger, provides power to system and charges battery through BATFET. Charge current can be adjusted automatically according to the feedback current which is detected with an internal resistor.

The device provides automatic power path selection for system from VBUS, battery or both. When battery voltage is above VSYS, BATFET is turned on and AXP717 enters supplement mode. If an adapter is not inserted, system current is provided only by battery. At this time, BATFET is at fully on state.

6.5 Power On/Off and reset

6.5.1 Power on reset(POR)

AXP717 is powered from the higher voltage between VBUS and BAT. When VBUS voltage(V_{VBUS}) is higher than V_{VBUS_UVLOZ} or BAT voltage(V_{BAT}) is higher than V_{BAT_UVLOZ}, the device is POR, and all registers are reset to the default value.

6.5.2 Power up from BAT

If only battery is present and V_{BAT} is higher than UVLO threshold , BATFET(connecting battery to system) is off by default and need to be turned on by pressing the PWRON key or inserting an adapter. Serial Interface communication is not available before power on.

6.5.3 Power up from VBUS

When VBUS is inserted and V_{VBUS} is higher than V_{VBUS_UVLOZ}, the VBUS insertion IRQ is sent and the register bit reg49H[7] is set to 1 to indicate VBUS is inserted. Then PMU detects the input source whether it is good or not. If VBUS is good, the RBFET is open and VSYS is working.

6.5.3.1 Good source condition

PMU needs to check the power capability of the input source. Only when the input source meets the following requirements can it start the buck converter.

a. VBUS voltage is lower than V_{ACOV}(typical 7V)

CopyrightShenzhen X-Powers Technology Co., Ltd. All Rights Reserved.

b. VBUS voltage is higher than $V_{VBUSUVLO}$ when pulling I_{BADBUS}(typical 15mA)

Once the input source meets the requirements above, the register bit reg00H[5](VBUS_GD) is set to 1 to indicate the input source is good.

6.5.3.2 Set input voltage limit(VINDPM)

AXP717 supports wide range of input voltage(3.9V~5.5V). V_{INDPM} can be set through reg16H[3:0]. The range of V_{INDPM} is from 3.88V to 5.08V and the step is 80mV.

When VBUS voltage reaches V_{INDPM}, the charge current will decrease automatically until the current is zero. If I_{SYS} is over the input power supply capability, VSYS will drop. If V_{BAT} is above VSYS, PMU will enter the supplement mode.

6.5.3.3 Set input current limit(IINDPM)

AXP717 supports input current limit to avoid adaptor overload. I_{INDPM} can be set through reg17H[5:0]. The range of I_{INDPM} is from 100mA to 3.25A and the step is 100mA.

When input current reaches I_{INDPM}, the charge current will decrease automatically until the current is zero. If I_{SYS} is over the input power supply capability, VSYS will drop. If V_{BAT} is above VSYS, PMU will enter the supplement mode.

6.5.4 System power on/off management

PMU has power off and power on status. When at off state, all voltage outputs are turned off except RTCLDO.

6.5.4.1 Power on-off Key (POK)

EN/PWRON pin can be customized as PWRON pin or EN pin. The default is PWRON pin. The Power on-off Key (POK) can be connected between PWRON pin and GND of AXP717. AXP717 can automatically identify the four status (Long-press, Short-press, Negative edge, Positive edge) and then correspond respectively.

6.5.4.2 Power on

1.When EN/PWRON pin is customized as PWRON pin, power on sources include:

(1). POK. AXP717 can be powered on by pressing and holding POK for a period of time that longer than “ONLEVEL”.

(2). VBUS low to high. The function can be configured by customization.

(3). VBAT low to high. The function can be configured by customization.

(4). IRQ Low level. IRQ pin is low level for more than 16ms, AXP717 will be powered on.The function can be configured by customization.

(5). Battery is charged to normal(VBAT>3.3V and is charging). The function can be configured by customization.

2.When EN/PWRON pin is customized as EN pin, AXP717 can be powered on by EN pin from low to high(0.6V).

Copyright Shenzhen X-Powers Technology Co., Ltd. All Rights Reserved.

After power on, DCDCs and LDOs will be soft booted in preset timing sequence. If IRQ low level is the power on source, AXP717 can be configured for fast power on by REG2FH [5], and the DCDCs/LDOs start sequence can be configured by REG2BH~REG2FH.

6.5.4.3 Power Off

1.When EN/PWRON pin is customized as PWRON pin, power off sources include:

(1). POK. AXP717 can be powered off by pressing and holding POK for a period of time that longer than "OFFLEVEL". The function can be configured by REG22H [1] and REG22H [0] decides whether the PMU auto turns on or not when it shuts down after OFFLEVEL POK.

(2). Write "1" to REG27H [0].

(3). VSYSGOOD high to low. When VSYS<VOFF or VBUS>7V, AXP717 will be powered off. The default of VOFF is 2.6V which can be configured by REG24H [6:4].

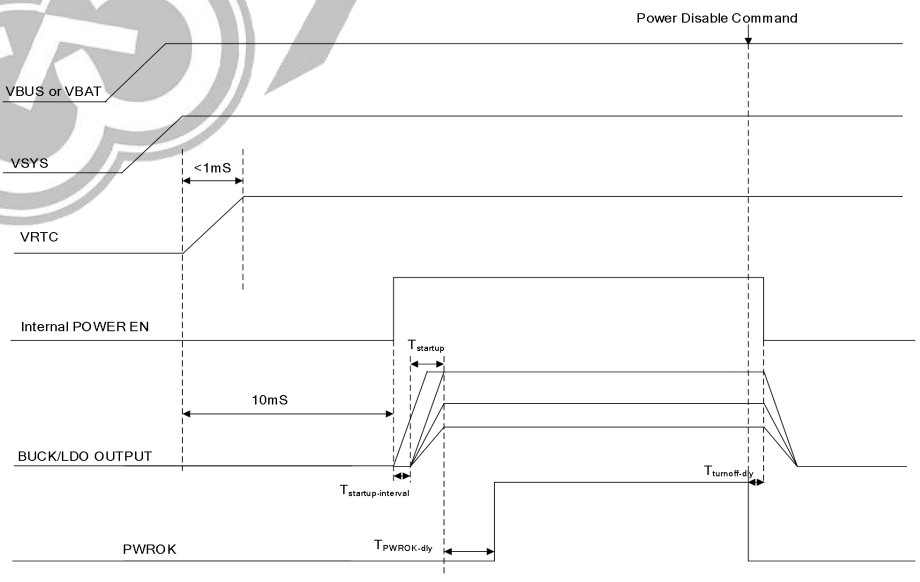
(4). The output voltage of DCDC is 15% lower than the setting value. The function can be configured by REG23H [3:0].

(5). The output voltage of DCDC is much larger than their setting(130%). The function can be configured by REG23H [4].

(6). Die temperature is over the warning level2(145℃). The function can be configured by REG22H [2].

(7). LDO over current(typical 500mA for ALDO/BLDO/CLDO). The function can be configured by REG22H [3].

Figure 6-1 System power up and shut down sequence



6.5.4.4 Sleep and wakeup

When the running system needs to enter Sleep mode, maybe one or several power outputs should be disabled or changed to other voltage. Wakeup can be initiated by the following sources:

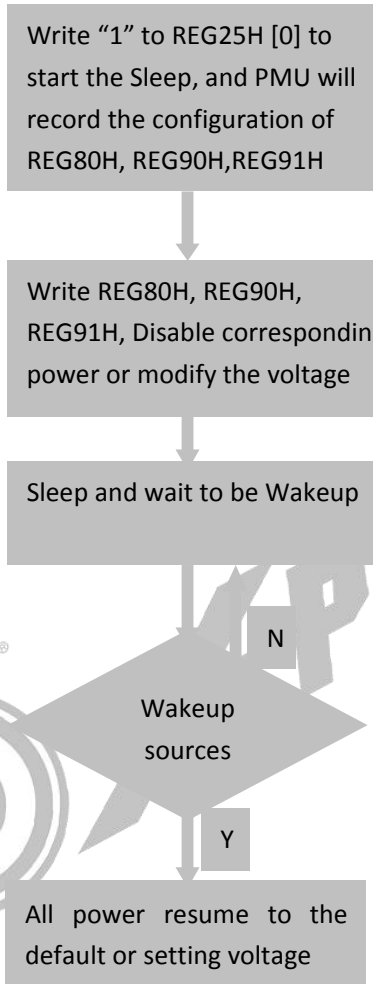
1. Software wakeup (REG25H [1] is set to 1)
2. IRQ pin wakeup (REG 25H [5] =1 and IRQ pin is low level for more than 4ms)

CopyrightShenzhen X-Powers Technology Co., Ltd. All Rights Reserved.

These sources will make all the power outputs resume to the default voltage or the setting voltage, which is configured by REG25H[2], and all shutdown powers will resume by the startup sequence.

The control process under sleep and wakeup modes is as below.

Figure 6-2 Sleep and Wakeup



6.5.4.5 System Reset

System reset means the related registers will be reset when PMU is power off. The system will power off and then power on. VRTC will not be off during restart. Restart can be initiated by the following sources:

(1). PWROK drive low.

The PWROK pin can be used as the reset signal of application system. During AXP717 startup, PWROK outputs low level, which will be pulled up to startup the system after output voltage reaches the regulated value.

When application system works normally, if the PWROK pin is driven low for 128us, the PMU will be restarted. The function can be configured by REG27H [3].

(2). Write “1” to REG27H [1] to restart the PMU.

(3). Watchdog timeout. The function can be configured by REG19H [0] and REG1AH [5:4].

Copyright Shenzhen X-Powers Technology Co., Ltd. All Rights Reserved.

6.5.4.6 POR

Power on reset means all the registers will be reset when PMU is power down. All voltage outputs are turned off including RTCLDO and VREF. Pressing and holding POK for more than 16s can force POR.

6.5.4.7 Fast power on/Fast Wake up

If fast power on and fast wake up function is enabled by REG3FH, all voltage outputs are turned on based on the timing sequence set by REG28H~REG2BH. The startup interval is 0.4ms.

6.5.4.8 Green mode

AXP717 has ultra-low power mode(Green mode) to support the application such as Elink.

There are two ways to let AXP717 enter to green mode.

(1) Disable all the power rails, and only enable CPUSLDO/DCDC3/BLDO2, then set REG1DH[0] to enable green mode. To exit green mode, host needs to clear REG1D[0].

(2) Set REG25H[0] to enter sleep mode, and configure the power rails on/off in sleep mode. Then set REG2AH[1] and REG25H[6] to let the device enter to both sleep and green mode automatically. In this way, there is a delay time before sleep and green mode taking effect.

In Green mode, the quiescent power consumption is much lower than normal status. However, the voltage output accuracy and capacity is worse. The following table shows the capacity and accuracy of the voltage output.

Table 6-1 The capacity and accuracy in Green mode

Output Path	Accuracy	Load Capacity(Max)
CPUSLDO	+-5%	10mA
RTCLDO	+-5%	5mA
DCDC3	+-5%	10mA
BLDO2	+-5%	5mA

6.6 Multi-Power Outputs

The following table has listed the multi-power outputs and their functions of AXP717.

Table 6-2 Multi-Power Outputs

Output Path	Type	Default Voltage	Startup Sequence	Application Suggestion	Load Capacity
DCDC1	BUCK	Customization	Customization	CPU	4000mA
DCDC2	BUCK			VSYS/VDD-USB/DRAM	3000mA
DCDC3	BUCK			VCC-DRAM	1500mA

CopyrightShenzhen X-Powers Technology Co., Ltd. All Rights Reserved.

DCDC4	BUCK			Not available in charger mode	3000mA
ALDO1	LDO			AVDD-CSI	400mA
ALDO2	LDO			IO/AF-CSI VCC-PE	200mA
ALDO3	LDO			VCC-USB/VCC-PL	200mA
ALDO4	LDO			AVCC/PLL/DRAM	400mA
BLDO1	LDO			WIFI	400mA
BLDO2	LDO			LPDDR	200mA
BLDO3	LDO			MOTOR	200mA
BLDO4	LDO			DVDD-CSI	400mA
CLDO1	LDO			MIPI/LVDS.etc	400mA
CLDO2	LDO			CTP	400mA
CLDO3	LDO			VCC-SENSOR/NAND.etc	400mA
CLDO4	LDO			LCD	400mA
VCPUS	LDO			CPUs	30mA
VRTC	LDO		Always on	RTC	30mA

AXP717 includes 4 synchronous step-down DCDCs and 14 LDOs. The work frequency of DC-DC 1/2/3 is 3MHz and DCDC4 is 1.5MHz. External small inductors and capacitors can be connected. In addition, DCDC 1/2/3 can be set in fixed PWM mode or auto mode (automatically switchable according to the load). See register REG81H.

DCDC1/2/3 has DVM enable option. In DVM mode, when there is a change in the output voltage, DCDC will change to the new targeted value step by step. It supports two kinds of DVM slope: 1 step/15.625us and 1step/31.250us. The slope can be chosen by REG82H [0].

AXP717 can configure the default voltage, the startup sequence and other control of all power output.

Startup sequence: The startup sequence has eight levels from 0 to 7. When the sequence is 0, it means the output is booted at the first step. When the sequence code is 1, it means the output is booted at the second step. When the sequence is 7, it means the output is not booted.

Default voltage setting: The default voltage of each channel can be set to each step within the output range.

6.7 Multi-Function Pin Description

EN/PWRON

Copyright Shenzhen X-Powers Technology Co., Ltd. All Rights Reserved.

EN/PWRON can be customized as EN pin or PWRON PIN. When it is configured as PWRON pin, a Power on-off Key (POK) can be connected between PWRON pin and GND. When it is configured as EN pin, it can be used for dial switch.

CLDO4/GPO1

It can be customized as LDO or GPO. When customized as GPO, it is push-pull. GPO1 output is configured by REG1CH [4].

CLDO3/GPO0

It can be customized as LDO or GPO. When customized as GPO, it is open-drain. GPO0 output is configured by REG1CH [0].

6.8 Charger

6.8.1 Characteristics

- Range of input voltage:3.9V~5.5V, switch charger, supports single cell Li-battery
- Pre-charge current settable ($I_{PRE-CHG}$, reg61H [3:0]), default:128mA, range: 0mA~960mA, step:64mA
- Fast charge current settable (I_{CHG}, reg62H[5:0]), default:1024mA, range: 0mA~3072mA, step:64mA
- Target charge voltage settable (V_{REG}, reg64H[2:0]), default:4.2V, range: 4.0v/4.1v/4.2v/4.35v/4.4v/5.0v
- Termination current settable(Iterm,reg63H[3:0]),default:384mA,range:64~1024,step:64mA
- Accuracy of target voltage:±0.5%(testing ambient temperature:25℃, target voltage:4.2V)

6.8.2 Charging condition

- VBUS is present and available, $V_{VBUS}>V_{BAT}+V_{SLEEPZ}$
- Input source detection finishes (reg00H [5] =1)
- Charging is enabled (reg19H [1] =1)
- Die temperature is lower than T_{SHUT}
- When TS pin is used to detect battery temperature, battery temperature is within the chargeable range
- V_{BAT} is lower than V_{BAT_OVP} and Battery is present
- No charger safety timer fault

6.8.3 Charging process

When PMU meets all charging conditions, it can complete the whole charging process without the participation of Host. The charging status can be known from the register bits reg01H[2:0]. The default values of charging parameters are shown as following. Host can modify registers to optimize the values through TWSI.

CopyrightShenzhen X-Powers Technology Co., Ltd. All Rights Reserved.

Table 6-3 Default values of charging parameters

Parameter	Default value
Charging voltage	4.2V
Charging current	1.024A
Pre-charging current	128mA
Termination current	320mA
Temperature profile	Cold/hot
Safety timer in fast-charge	12hours

6.8.3.1 Pre-charge

When V_{BAT} is lower than $V_{BATLOWV}$(3V), the charger is under pre-charge mode where charging current is limited to a value of $I_{PRE-CHG}$. Safety time in pre-charge is 50 minutes. If pre-charge process times out, PMU will stop charging and send a corresponding IRQ to Host. The function of safety timer can be disabled through reg67H [2].

6.8.3.2 Constant current charge

Once V_{BAT} is higher than $V_{BATLOWV}$ and lower than V_{REG}, the charger is under constant current charge mode. It will charge with constant current I_{CHG}.

6.8.3.3 Constant voltage charge

When V_{BAT} reaches target voltage (V_{REG}), the charger enters constant voltage charge mode. In this stage, the charger keeps the output voltage constant and step down charging current gradually, in order to fully charge battery.

When V_{BAT} is above V_{RECHG} and the charging current reduces under termination current (I_{TERM}), AXP717 reports charger done, stops charging (charger enable bit is still 1) and turns off BATFET. Meanwhile, IRQ is sent to Host.

When AXP717 is in regulation of input current(IDPM), input voltage(VDPM) or temperature(thermal regulation), the function of charging termination configured through reg63 H[4] is temporarily disabled and the speed of safety timer slows down. Whether to set safety timer during DPM or thermal regulation depends on reg67H [7].

6.8.3.4 Re-charge

After charge done, if V_{BAT} falls below V_{RECHG}, PMU will automatically enable charger without reinserting adapter.

No matter whether V_{BAT} is above V_{RECHG} or not, the charger is enabled when an adapter is inserted.

6.8.3.5 Battery detection

As long as an AC adapter is present and usable, battery detection will be enabled to detect whether battery is connected. Battery detection function is enabled by default and can be disabled through reg68H [0]. If the function is disabled, PMU considers that battery is always present. The detection result is saved in reg00H [3]

Copyright Shenzhen X-Powers Technology Co., Ltd. All Rights Reserved.

6.8.4 Charging protection

6.8.4.1 charger safety timer

Once starting pre-charge mode, PMU will enable timer1. If PMU cannot enter constant current charge mode from pre-charge within 50 minutes, PMU will enter battery safe mode and send IRQ to indicate the battery may be damaged.

When the charger enters into constant current charge mode, PMU will enable timer2. If PMU cannot finish the whole charge cycle within 12 hours, PMU will enter battery safe mode and send IRQ to indicate the battery may be damaged.

6.8.4.2 Battery safe mode

In battery safe mode, the charger always charges with 10mA current. PMU can quit battery safe mode with one of the following methods:

- $V_{BAT}>V_{RECHG}$
- Adapter removal
- Charger enable bit (reg18H [1]) is reset to 1
- Safety timer1 enable bit(reg67H [2]) or safety timer2 enable bit(reg67H [6]) is reset to 1

6.8.4.3 PMU die temperature protection

AXP717 has built-in temperature protection function through ADC to monitor internal temperature.

Under charging mode, the temperature point of thermal regulation can be set through reg65H[1:0]. When die temperature rises up to the setting point, the charging current will be decreased to decrease heat. When thermal regulation works, actual charge current is lower than the setting value and thermal regulation status(reg00H [1]) is set to 1. If die temperature rises up to T_{SHUT} (145℃), IRQ is sent and PMU is power off. When die temperature falls below hysteretic threshold (120℃), PMU is not power on automatically.

6.8.4.4 Battery temperature protection

AXP717 can monitor battery temperature, when TS pin is used to detect battery temperature and parallel with charger(reg50H[4]=0). The battery temperature sensitive resistor is connected between TS pin and GND. The suggestion resistance should be 10Kohm at 25℃ ambient temperature. Through TS pin, PMU outputs constant current which can set through reg50H [1:0] to adapt different resistance. When the resistance is 10Kohm, the current should be set to 50uA. The enable bit of TS current source is configured through reg50H [3:2]. When current passes through the temperature sensitive resistor, PMU gets a detected voltage and calculates its value through ADC circuit. Take for example, TH11-3H103F temperature sensitive resistor of Mitsubishi Company. Using 50uA current source, the relationship among temperature, equivalent resistance, detected voltage and ADC data is as following.

Table 6-4 Relationship among temperature, equivalent resistance, detected voltage and ADC data

Temperature	equivalent resistance	detected voltage	ADC DATA

Copyright Shenzhen X-Powers Technology Co., Ltd. All Rights Reserved.

-20℃	63.00Kohm	3.150V	189Ch
-15℃	50.15Hohm	2.508V	1398h
-10℃	40.26Kohm	2.013V	FBAh
-5℃	32.55Kohm	1.628V	CB8h
0℃	26.49Kohm	1.325V	A5Ah
5℃	21.68Kohm	1.084V	878h
10℃	17.78Kohm	0.889V	6F2h
15℃	14.63Kohm	0.732V	5B8h
20℃	12.07Kohm	0.604V	4B8h
25℃	10.00Kohm	0.500V	3E8h
30℃	8.320Kohm	0.416V	340h
35℃	6.954Kohm	0.348V	2B8h
40℃	5.839Kohm	0.292V	248h
45℃	4.924Kohm	0.246V	1ECh
50℃	4.171Kohm	0.209V	1A2h
55℃	3.549Kohm	0.177V	162h
60℃	3.032Kohm	0.152V	130h

During battery charging process, if TS pin voltage is lower than VHTF-CHG or higher than VLTF-CHG (VHTF-CHG and VLTF-CHG can be set through reg55H and reg54H. The default value of VLTF-CHG is set around 0℃ and VHTF-CHG around 45℃), which indicates battery temperature is too high or too low, then the charger is paused and IRQ is sent to notify Host. When battery temperature is back to the normal range, the charger will recovery automatically.

Copyright Shenzhen X-Powers Technology Co., Ltd. All Rights Reserved.

During battery discharging mode, if TS pin voltage is lower than VHTF-WORK or higher than VLTF-WORK (VHTF-WORK and VLTF-WORK can be set through reg57H and reg56H. The default value of VLTF-WORK is set around -10℃ and VHTF-WORK around 55℃), which indicates battery temperature is too high or too low, then the boost is paused and IRQ is sent to notify Host. When battery temperature is back to the normal range, the boost will recovery automatically.

High temperature protection threshold hysteresis for VHTF-CHG and VHTF-WORK can be set through reg53H. Low temperature protection threshold hysteresis for VLTF-CHG and VLTF-WORK can be set through reg52H. The range of temperature detection can be expanded by adding more resistors.

Some battery may have no temperature sensitive resistor. Under this situation, TS pin can be pulled down to GND with a 10Kohm resistor externally or set as external input of ADC through register.

6.8.5 Charging indication

CHGLED pin uses open-drain/push-pull output method. It is internally pulled up to LDO. Its output drive capability is above 10mA. Detail function control is shown as the following table.

Table 6-5 CHGLED function

REG70H [2:0] = 000 (Type A CHGLED) Open Drain	Hi-Z	No charging(conditions are not met or battery charged)
	25% 1Hz pull low/Hi-Z jump	Charger internal abnormal alarm(including timer out、die temperature over temperature、battery temperature out of charging range)
	25% 4Hz pull low/Hi-Z jump	Input source or battery over voltage
	Pull low	Charging
REG70H [2:0] = 001 (Type B CHGLED) Open Drain	Hi-Z	No VBUS, and power supply by battery
	25% 1Hz pull low/Hi-Z jump	Charging
	25% 4Hz pull low/Hi-Z jump	Alarm, including input source or battery over voltage, battery temperature out of charging range, timer out ,die temperature over temperature
	Pull low	No battery or charge finished, and power supply by VBUS
REG70H[2:0]=010 Breathing LED	Breathing LED controlled by charger(Breathing LED on in charging status)	
REG70H[2:0]=011	Breathing LED controlled by REG70H[6]	

CopyrightShenzhen X-Powers Technology Co., Ltd. All Rights Reserved.

Breathing LED	
REG70H[2:0]=110 CFG CHGLED	The output status is controlled by REG70H[5:4]

Note: 1. LED is on when CHGLED pin is low. 2.Breathing LED display behavior controlled by REG72H~REG78H

6.8.6 DCDC4 mode

AXP717 works in charger mode by default to support single-cell applicaiton. If it is used in multi-cell or non-battery application, the charger module can be used as DCDC4. In DCDC4 mode, charger module works as a common buck, and CHGLED pin works as the feedback of DCDC4. In order to support multi-cell gauge, gauge will measure the battery voltage by external resistor divider from DP pin instead of VBAT pin. In DCDC4 mode, charging indication/battery detection/USB typeC/BC1.2 function is not available. User can select DCDC4 or charger mode by customization.

6.9 BOOST

AXP717 supports boost converter operation to deliver battery power to VBUS or VMID. The maximum output current support 1.5A. If below conditions are valid, boost will be enabled,

(1)V_{BAT} is higher than boost mode disable threshold(REG1EH[3:2], default is 2.6V)

(2)VBUS voltage is lower than VBAT+V_{SLEEP}

(3)Boost mode is enabled(REG19H[4]=1)

(4)Voltage at TS pin is within working range (REG56H/57H)

6.10 BATFET

BATFET connects system and battery. The on-resistance is low to 30mohm. The minimum system voltage is set by REG15H[2:0]. When battery voltage is below minimum system voltage, the BATFET operates in linear mode and system voltage is regulated at minimum system voltage setting. As the battery voltage rises, the BATFET can turn to full on.

If only battery is present , BATFET is off when the system is power off and can be turned on again by pressing the PWRON key or inserting an adapter.

6.11 RBFET

RBFET connects VMID and VBUS. The on-resistance is low to 100mOhm. It supports input and output current limit function. In boost mode, the output current limit value of RBFET is set through reg1EH [1:0].

Copyright Shenzhen X-Powers Technology Co., Ltd. All Rights Reserved.

6.12 ADC

AXP717 has a low speed 14 Bits SAR ADC for measuring BAT voltage, VBUS voltage, VSYS voltage, TS voltage and die temperature.

Table 6-6 ADC channel

No.	Channel function	000H	001H	002H	…	FFFH
0	BAT voltage	0mV	1mV	2mV	…	8.192V
1	VBUS voltage	0mV	1mV	2mV	…	8.192V
2	VSYS voltage	0mV	1mV	2mV	…	8.192V
3	TS voltage	0mV	0.5mV	1mV	…	4.096V
4	die temperature	0mV	0.1mV	2mV	…	0.8192V

Note: ADC data is 14 bits. In order to get the complete data, TWSI must read the high 6 bits firstly and then the low 8 bits.

6.13 E-Gauge

The Fuel Gauge system is able to export information about battery capacity percentage (regA4H) and Battery Voltage (regC4H, regC5H). The Fuel Gauge can be enabled or disabled through reg0BH[2]. The Battery low warning level can be set through reg1BH, and IRQ will be sent out to alert the platform when the battery capacity percentage is lower than the warning level set through reg1BH.

Once a default battery is selected for a particular design, it is highly recommended to program the battery module to achieve better Fuel Gauge accuracy. Once the battery module data are available, user can write these information to battery parameter (REGA1H) after brom is enabled on each boot. Additionally, the Fuel Gauge system is capable to learn the battery characteristic automatically.

6.14 IRQ /BACKUP

6.14.1 IRQ

AXP717 has an IRQ pin which is used to indicate whether there interrupt events occur.

PMU Interrupt Controller monitors the trigger events such as over voltage, over current, PWRON pin signal, over temperature and so on. When the events occur and their IRQ enabled bits are set to 1 (Refer to registers

CopyrightShenzhen X-Powers Technology Co., Ltd. All Rights Reserved.

reg40H~44H), corresponding IRQ status will be set to 1 (Refer to registers reg48H~4CH), and IRQ pin will be pulled down. When Host detects triggered IRQ signal, Host will scan through the IRQ Status registers and respond accordingly. Meanwhile, Host will reset the IRQ status by writing “1” to status bit.

6.14.2 BACKUP

AXP717 has a backup pin which is used to connect backup battery. It is the source of RTCLDO when PMU has only backup battery.

When PMU is power on, the backup battery also can be charged by configuring reg19H[3]. The charger is working under linear mode with 100uA charge current and the termination voltage can be configured by reg6AH in range from 2.6V to 3.3V (default 2.9V).

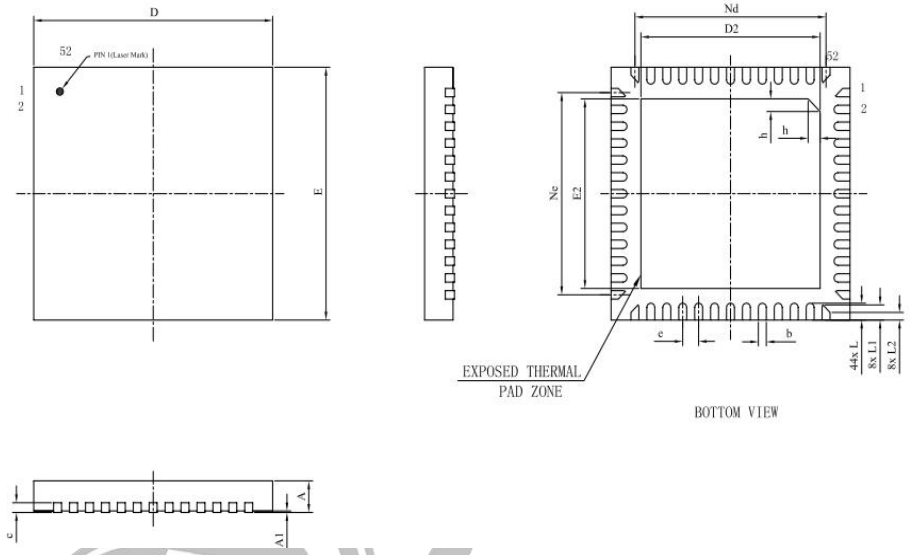
8 Package, Carrier, Storage and Baking Information

8.1 Package

AXP717 package is QFN6*6, 52-pin. Figure 8-1 shows AXP717 package.

Figure 8-1 Package Information



SYMBOL	MILLIMETER		
	MIN	NOM	MAX
A	0.70	0.75	0.80
A1	—	0.035	0.05
b	0.15	0.20	0.25
c	0.18	0.20	0.25
D	5.90	6.00	6.10
D2	4.40	4.50	4.60
e	0.40BSC		
Nd	4.80BSC		
E	5.90	6.00	6.10
E2	4.40	4.50	4.60
Ne	4.80BSC		
L	0.35	0.40	0.45
L1	0.31	0.36	0.41
L2	0.13	0.18	0.23
h	0.25	0.30	0.35
L/F载体尺寸 (mil)	185*185

T	0.30±0.05	D1	$\phi 1.50^{+0.10}_{0.10}$				

Table 8-2 AXP717 Packing Quantity Information

Type	Quantity	Part Number
Tape	3000pcs/Tape	AXP717

8.3 Storage

8.3.1 Moisture Sensitivity Level(MSL)

A package's MSL indicates its ability to withstand exposure after it is removed from its shipment bag, a low MSL device sample can be exposed on the factor floor longer than a high MSL device sample. ALL MSL are defined in the following table.

Table 8-3 MSL Summary

MSL	Out-of-bag floor life	Comments
1	Unlimited	≤30℃/85%RH
2	1 year	≤30℃/60%RH
2a	4 weeks	≤30℃/60%RH
3	168 hours	≤30℃/60%RH
4	72 hours	≤30℃/60%RH
5	48 hours	≤30℃/60%RH

Copyright Shenzhen X-Powers Technology Co., Ltd. All Rights Reserved.

5a	24 hours	≤30℃/60%RH
6	Time on Label(TOL)	≤30℃/60%RH

AXP717 device samples are classified as MSL3.

8.3.2 Bagged Storage Conditions

The shelf life of AXP717 are defined in the following table.

Table 8-4 Bagged Storage Conditions

Packing mode	Vacuum packing
Storage temperature	20℃~26℃
Storage humidity	40%~60%RH
Shelf life	6 months

8.3.3 Out-of-bag Duration

It is defined by the device MSL rating. The out-of-bag duration of AXP717 is as follows.

Table 8-5 Out-of-bag Duration

Storage temperature	20℃~26℃
Storage humidity	40%~60%RH
Moisture Sensitivity Level(MSL)	3
Floor life	168 hours

For no mention of storage rules in this document, please refer to the latest ***IPC/JEDEC J-STD-020C***.

8.4 Baking

It is not necessary to bake AXP717 if the conditions specified in Section 8.4.2 and Section 8.4.3 have not been exceeded. It is necessary to bake AXP717 if any condition specified in Section 8.4.2 and Section 8.4.3 have been exceeded.

Table 8-6 Baking Conditions

Surrounding	Condition	Note
Nitrogen	Tray: 125℃/8 hours Tape: 60℃/72 hours	Recommended condition. It is recommended to bake once, no more than three times.

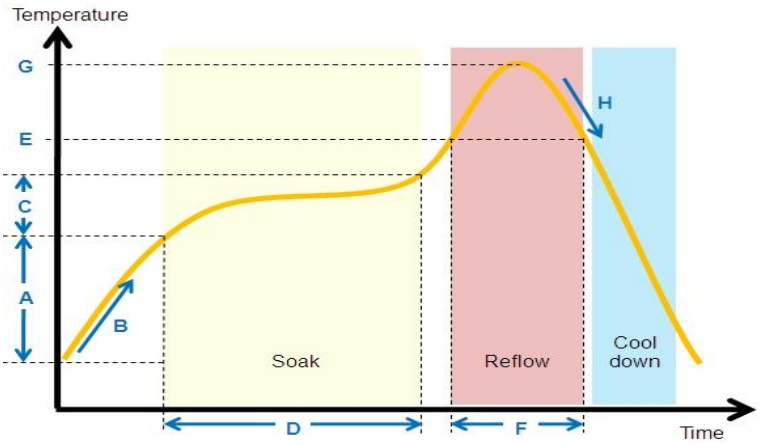
9 Reflow Profile

The reflow profile recommended in this document is a lead-free reflow profile that is suitable for pure lead-free technology of lead-free solder paste.

The following figure shows the typical reflow profile of AXP717 device sample.

Figure 9-1 AXP717 Typical Reflow Profile



Reflow profile conditions of AXP717 device sample is given in the following table.

Table 9-1 AXP717 Reflow Profile Conditions

	QTI typical SMT reflow profile conditions (for reference only)	
	Step	Reflow condition
Environment	N2 purge reflow usage (yes/no)	Yes, N2 purge used
	If yes, O2 ppm level	O2 < 1500 ppm
A	Preheat ramp up temperature range	25℃ -> 150℃
B	Preheat ramp up rate	1.5~2.5 ℃ /sec
C	Soak temperature range	150℃ -> 190℃
D	Soak time	80~110 sec
E	Liquidus temperature	217℃
F	Time above liquidus	60-90 sec
G	Peak temperature	240-250℃
H	Cool down temperature rate	⩽4℃ /sec
